Patent No. US2002016534641

GENERAL INFORMATION:

APPLICANT: Schering-Plough Corporation
TITLE OF INVENTION: MAMMALIAN MEMBRANE PROTEIN GENES; RELATED REAGENTS
PILE REFERENCE: SF06958

CURRENT APPLICATION UNDER: US/09/862,802

CURRENT FILING DATE: 1098-07-08

PRIOR FILING DATE: 1998-07-08

GENERAL INFORMATION:

TITLE OF INVENTION:

FILE OF INVENTION: NOVEL ANTIBEDIES THAT BIND TO ANTIGENIC POLYPEPTIDES, NUCLEIC ACLT

TITLE OF INVENTION: ENCODING THE ANTIGENS, AND METHODS OF USE

FILE REFERENCE: 21402-347A

CURRENT APPLICATION NUMBER: 60/288,395

PRIOR PILING DATE: 2001-05-03

PRIOR FILING DATE: 2001-05-03

PRIOR FILING DATE: 2001-08-17

PRIOR PLILING DATE: 2001-08-17

PRIOR PLILING DATE: 2001-08-17

PRIOR PLILING DATE: 2001-09-25

PRIOR FILING DATE: 2001-05-04

NUMBER OF SEQ ID NOS: 203

SERIOR DATE: 2001-05-04

SERIOR PLING DATE: 2001-05-04

TITLE OF INVENTION: Isolated Mammalian Membrane Protein Genes; Related Reagents
FILE REFERENCE: S76055 B
CURRENT APPLICATION NUMBER: US/09/862,802A
PRIOR APPLICATION NUMBER: US 60/053,080
PRIOR FILING DATE: 1997-07-09
PRIOR PLING DATE: 1997-07-09
PRIOR APPLICATION NUMBER: US 09/111,470
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

with abnormal physiology or development.

Claim 2; Page 68-69; 82pp; English.

Dendritic cell membrane protein 1 (DCWP1) and DCMP2 nucleic acids can be used as markers for distinguishing cell types, including genomic aspects of cells, as well as mRNA and protein expression patterns. They can also be used to detect chromsomal abnormalities. The proteins can be used to dispance disorders associated with expression misregulation. They can also be used to treat conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degeneration and atrophy may be modulated using the proteins. The proteins may also play a role in regulation or development of manacopoletic cells

treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cases, ischaemia-reperfusion injury, shock, sepsis, immune responses cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral cervous system diseases and neuropathies, such as Alzheimer's disease, Parkinson's disease, Huntington's disease and amyotrophic lateral sclerosis. The sequences are involved in chemocactic or chemokinetic activity, regulation of haematopoiesis, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocycopenia, regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, tissue repair, healing of burns, inclaions, ulcers, treatment of esteoporosis, osteoporation of bone, cartilage, tendon, ligament and/or nerve tissue court, tissue repair, healing of burns, inclaions, ulcers, treatment of steoporosis, osteoporation and treatment of lung or liver fibrosis, repertusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal influry in various tissues, immune deficiencies and mysthemia gravis, allergic conditions such as asthma, thrombolysis or thrombosis and coagulation disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      preferably a NOWX-associated disorder. The sequences are useful for treating, preventing or diagnosting diseases such as metabolic disorders, diabetes, obesity, infectious diseases (urlal, bacterial, fungal, helminthic, and protozoal, anorexia, cancer, cardiovascular disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders (e.g. sethman and various dyslipidemic disorders, inflammatory skin disorders, asthma and various dyslipidemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and anglogenesis, and in the generation of antibodies that bind immunospecifically to NOVX substances
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful in the manufacture of a medicament for treating a syndrome associated with a human disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Boldog FL, Burgess CL, Lach V, Gorman L, Gunther E, Guo X; Liu X, Malyankar UM, Miller CE; Liu X, Malyankar UM, Rieger DK, Shenoy SG; Crivalan M, Pena CEA, Rieger DK, Shenoy SG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, antherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, multiple sclerosis, infections, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), haematopoietic disorders and watting disorders. The polynucleotides are also used as Mybridisation probes, in chromosome mapping and in tissue typing. The polypeptides are also useful as vaccines. This sequence represents a human NOVX polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, atherosclerosis, asthma or AIDS, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FL, Burgess CE, Casman SJ;

diagnose disorders associated with expression misregulation. They can also be used to treat conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. Abnormal proliferation, regeneration, degeneration and atrophy may be modulated using the proteins. The proceins may also play a role in regulation or development of haematopoietic cells

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The polypeptides, polynucleotides and antibodies that bind encoding them. The polypeptides are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, confidence associated with a human disease, preferably a NOVX-associated disorder. The sequences are useful for treating, preventing or diagnosing diseases such as metabolic disorders, clabetes, obesity, infectious diseases (viral, bacterial, fungal, chalminthic, and protozoal), anorexia, cancer, cardiovascular disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders (e.g. hypertension, atherosclerosis), neurodegenerative disorders (c.g. disease, Parkinson's disease), epilepsy, immune disorders, asthma and various dyslipidemias. The nucleic acids and polypeptides may also used as targets for the identification of small molecules that module conflectation, haematopoiesis, wound healing and angiogenesis, and in the proliferation, haematopoiesis, wound healing and angiogenesis, and in the correct or disagnostic methods. The nucleic caids are further used as hybridisation probes, and in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. Sequences ABU69126-CABU69171 represent human NOVX polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TVAEIQALTSQGSSLEETIASLKAEVEGFKQERQAGVSELQEHTTQKAHLGHCPFCVC 142

The invention relates to human NOVX polypeptides and the polynucleotides encoding them. The polypeptides, polynucleotides and antibodies that bind immunospecifically to the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders such as cardiomyopathy, atherosclerosis, hypertension, scleroderma, obesity, cancer, diabetes, multiple sclerosis, infections, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), haematopoietic disorders and wasting disorders. The polynucleotides are also used as hybridisation probes, in chromosome mapping and in tissue typing. The polypeptides are also useful as vaccines. This sequence represents a human NOVX polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                             New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, atherosclerosis, asthma or AIDS, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  83 TVABIQALTSQGSSLBETIASLKAEVEGFKQERQAGVSELQEHTTQKAHLGHCPRVC 142

The appearance of autoautibodies against AGPR H1 can be used as an indicator for autoimmune hepatitis (AIH), a disease that can lead to cirrhosis and fatal intractable hepatitis. Novel soluble derivatives (see AAW15249-50) comparise the extracellular domain or extracellular plus cytoplasmic domains of AGPR H1. These can be produced on a large scale, and free of contaminating liver antigens, by PCR amplification of relevant portions of AGPR H1. Chook (see AAW15255) and expression in bacterial (pref. E. coli) or animal (pref. mammalian) host calls. AGPR L-H2 (see AAW15246) and its soluble derivatives can be used in a claimed method for detecting and measuring anti-AGPR antibodies, e.g. by ELISA, Western blotting, etc. This allows AIH to be diagnosed and distinguished from other diseases. The AGPR derivatives can distinguished from other diseases. The AGPR derivation of asialoglycoproteins and to develop inhibiting agents against asialoglycoproteins and to develop, or viral and cother protein invasion, into liver cells

selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimune/filfalmmatory disorder, developmental disorder, endocrine disorder, neurological disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals molecules may also be used in genetic mapping, in identifying individuals promorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the gene therapy. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FQNSKFQRDLVTLRTDFSNFTSNTVAEIQALTSQGSSLEETIASLKAEVEGFKQERQAGV 119

polynucleotide of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine austorial and insorders, or autolimune/fillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanchillammanch

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A colymucleotide of the invention may have a use in gene therapy. The human colymucleotides (dithp) or polymepaper. The human changes and therapeutic polymucleotides (dithp) or polymeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules. e.g. cell proliferative disorders, endorine autoimmune/inflammatory disorder, gastrointestinal disorder, or disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungior parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide colymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represente a dithp protein of the cinvention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                              Wright RJ; Bruns CM, Marjanovic MM, Shen F;

(INCY-) INCYTE CORP.

Human diagnostic and therapeutic pprotein SEQ ID NO:2824.

(first entry)

18-NOV-2004 ABM82575;

```
The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A puricleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp inflections caused by virus, bacteria, fungi or parasite. The dithp conflection and also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp protein of the gene therapy. The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/llsting.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gietzen D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, or autoimmune/inflammatory disorder, developmental disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp inflammatory also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            60 FONSKFORDLVTLRTDFSNFTSNTVAEIQALTSQGSSLEETIASLKAEVEGFKQERQAGV 119

The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A polymucleotide of the invention may have a use in gene therappy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorder, gastrolitestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gent therapy. The present sequence represents a dithp protein of the invention. Note: The sequence data for this parent is not represented in the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                          New diagnostic and therapeutic polynucleotides and polypeptides, useful in diagnosing a condition, disease or disorder associated with human molecules, e.g. autoimmune or inflammatory disorders, in gene therapy or

```
This polypeptide sequence comprises the cytoplasmic (CTD) and extracellular (ECD) domains of human full-length asialoglycoprotein extracellular (ECD) domains of human full-length asialoglycoprotein creeptor (AGEP) HI (See AAM15245). It can be produced on a large scale, in a form free of contaminating liver antigens, by PCR amplification (see AAM16962-65) of CTD+ECD DNA (see also AAM166950), and expression in becterial (pref. E. coll) or animal (pref. mammalian) host cells. The ECD alone (AAM15249) and AGPR L-H2 derivatives (see AAM15251-52) are also claimed. The appearance of autoantibodies against AGPR can be used as an indicator for autoimmune hepatitis (AIH), a disease that can lead to cirrhosis and fatal intractable hepatitis. Recombinant soluble AGPR crivatives can be used in a claimed method for detecting and measuring anti-AGPR antibodies, e.g. by ELISA, Western blotting, etc. This allows AIH to be diagnosed and distinguished from other diseases. AGPR and purification of asialoglycoproteins and to develop inhibiting agents against asialoglycoproteins and to develop inhibiting agents invasion, into liver cells. (Updated on 17-OCT-2003 to standardise OS
